6.4L Power Stroke® Diesel Engine

2008 “F” SERIES SUPER DUTY

- Engine Description
- Systems Overview
- Component Location
- Technician Tips
FORWARD

This publication is intended to provide technicians and service personnel with an overview of technical advancements in the 6.4L POWER STROKE® DIESEL Engine. The information contained in this publication will supplement information contained in available service literature.

IMPORTANT SAFETY NOTICE

Appropriate service methods and proper repair procedures are essential for the safe, reliable operation of all motor vehicles, as well as, the personal safety of the individual performing the work. This manual provides general directions for accomplishing service repair work with tested, effective techniques. Following the directions will assure reliability. There are numerous variations in the procedures; techniques, tools, parts for servicing vehicles and the skill of the individual doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this manual must first establish that they do not compromise their personal safety or the vehicle integrity by their choice of methods, tools or parts.

The following list contains some general WARNINGS that you should follow when you work on a vehicle.

Always wear safety glasses for eye protection.

Always perform work in a well ventilated area.

Use safety stands whenever a procedure requires you to be under the vehicle.

Be sure that the ignition switch is always in the OFF position, unless otherwise required by the procedure.

Never perform any service to the engine with the air cleaner removed and the engine running unless a turbocharger compressor inlet shield is installed.

Set the parking brake when working on the vehicle. If you have an automatic transmission, set it in PARK unless instructed otherwise for a specific service operation. If you have a manual transmission, it should be in REVERSE (engine OFF) or NEUTRAL (engine ON) unless instructed otherwise for a specific service operation.

Operate the engine only in a well-ventilated area to avoid the danger of carbon monoxide.

Keep yourself and your clothing away from moving parts when the engine is running, especially the fan, belts, and the turbocharger compressor.

To prevent serious burns, avoid contact with hot metal parts such as the radiator, turbocharger pipes, exhaust manifold, tail pipe, catalytic converter and muffler.

Do not smoke while working on the vehicle.

To avoid injury, always remove rings, watches, loose hanging jewelry, and loose clothing before beginning to work on a vehicle. Tie long hair securely behind the head.

Keep hands and other objects clear of the radiator fan blades.

6.4L Power Stroke® Diesel

Direct Injection Turbocharged Diesel Engine
6.4L Power Stroke Diesel Overview

- This publication is not intended to replace the Service Manual but to introduce the 6.4L Power Stroke® Diesel Engine.

6.4L Power Stroke Diesel Direct Injected Turbocharged Diesel Engine Overview

- Engine Features
- Horsepower & Torque
- Engine Specifications
- Physical ID
- Labeling

Engine Features

- The 6.4L Power Stroke Diesel has been designed to meet the tougher emissions standards set by the government.
- The 6.4L Power Stroke Diesel has been designed to meet the customers’ expectations of high horsepower and torque over a wide RPM range.
- Meeting the more stringent customer and regulated demands are accomplished in part by: High Pressure Common Rail Fuel System, Series Sequential Turbocharger System, 4 valves per cylinder, and a dual timing system.

Horsepower & Torque

- The 6.4L Power Stroke Diesel creates 350 horsepower at 3000rpm and 650 lb/ft of torque at 2000rpm.

**Specifications**
- The cylinders of the 6.4L Power Stroke Diesel are numbered from the front on the right side 1,3,5,7 and from the front on the left side 2,4,6,8.
Engine Serial Number

- The engine serial number is located on the left rear corner of the crank case on a half moon machined surface.
- A white sticker is placed over this number during production, this sticker was removed for illustration purposes.
- 6.4 - is the engine family identifier.
- HU2Y - is a manufacturing designator

Ex: HU2Y or HU2U “Y designates Huntsville, AL and U designates Indianapolis, IN”
- 0385535 - is a sequential build number

Serial Number Label

- Located on the top of the vertical EGR cooler.
- States the engine serial number.
  - example at right, “0385535”
- States the engine family.
  - example at right, “6.4L DI turbo diesel”

Emissions Label

- States the horsepower rating for the engine, programmed in the Engine Control Module (ECM).
- Depicts where the engine meets or exceeds emission standards.
- Shows the engine displacement.
- Is affixed to the right hand valve cover.
- F250/350 labels are red.
- F450/550 labels are blue.

10) ECM Connection
High Pressure Common Rail Fuel System
• The 6.4L Power Stroke Diesel engine uses a high pressure fuel injection pump to deliver fuel to each piezo electric fuel injector via a high pressure common fuel rail, one rail per bank.

Cylinder Head & Head Bolts
• The 6.4L Power Stroke Diesel uses a four (4) valve per cylinder head design to optimize airflow and efficiency.
• The 6.4L Power Stroke Diesel engine uses larger head bolts than the 6.0L Power Stroke Diesel engine (M16 vs M14).
• The 6.4L head bolts are also slightly shorter than the 6.0L head bolts. The 6.4L head bolts do not retain the rocker carrier like the 6.0L head bolts do.

Fulcrum Plate & Rocker Arms
• The fulcrum plate, which holds the rocker arms, is bolted to the rocker pedestal.
• The two (2) bolts that secure the fulcrum plate pass through the fulcrum plate and the rocker pedestal and are then secured into the cylinder head.
High Pressure Fuel Injection Pump & Rear Geartrain
- The geartrain for the crankshaft, camshaft, and the high pressure fuel injection pump are located in the rear of the engine under the rear cover.
- This allows for the high pressure fuel pump to be mounted inside the engine and also reduces noise.
- The high pressure fuel injection pump turns at a ratio of 1:1 with crankshaft speed.

NOTE: The helical cut gears used on the 6.4L differ from those used on the 6.0L.

6.4L vs 6.0L Flexplate
- The flexplate for the 6.4L automatic equipped engine uses an 8 bolt torque converter bolt pattern.
- The flexplate for the 6.0L automatic equipped engine uses a 6 bolt torque converter bolt pattern.

NOTE: Yellow circle added for bolt circle reference.

Rocker Pedestal
- The rocker pedestal is secured independent of the cylinder head bolts, which no longer need to be removed to service the rocker arms.
Cooling System Features

- The coolant pump can be serviced without disconnecting radiator hoses.
- Both the glow plug sleeves and the injector sleeves are stainless steel.

Cooling System Features

- Coolant Pump
- Stainless Steel Injector Sleeves
- Stainless Steel Glow Plug Sleeves

Internal Coolant Flow
Cooling System Flow: External Flow

- Coolant is drawn into the inlet of the front cover from the bottom radiator port and then flows from the coolant pump through the front cover to the crankcase.
- Coolant is also routed from the front cover into the crankcase to a passage that feeds the oil cooler (shown on next page).
- Coolant is routed from the front cover to the EGR coolers, EGR valve, degas bottle, and the vehicle heater core.
- The horizontal EGR cooler receives coolant first, then the coolant travels to the vertical EGR cooler through a short connection hose. Hot coolant exits the vertical EGR cooler at the top and enters into the front cover.
- A port next to the hot EGR return port in the front cover routes hot coolant to the heater core for vehicle heating. The coolant then travels to a Y-pipe where it meets with degas return coolant before being sent into the front cover, just above the main coolant inlet from the radiator.
- The EGR valve receives its coolant from a passage at the top of the vertical EGR cooler. Once the coolant exits the EGR valve it is sent to the degas bottle (this passage is the highest point in the system and is also the deaeration port).
- The port directly below the EGR valve return/deaeration port on the degas bottle is used as a radiator fill/overflow line connecting with the top of the radiator.
- A dual thermostat system is used to control the flow of return coolant to the radiator. If the thermostats are open, coolant flows to the radiator to be cooled. The bottom thermostat has a bypass circuit that will allow coolant to return to the pump when the thermostats are closed (speeding engine warm up).
Cooling System Flow: Back of Front Cover
- Coolant is sealed via a metal one piece gasket and is directed out of the front cover through three (3) passages.
- Two of the passages route coolant to the crankcase to cool the cylinder walls and cylinder heads (there are different sized orifices pressed into the crankcase in these two passages).
- The third passage routes coolant to the oil cooler via a passage in the crankcase.
- There are two passages for coolant to return from the crankcase into the front cover.

Cooling System Flow: Oil Cooler
- Coolant is directed out of the crankcase and into the oil filter base at the front of the engine.
- The oil filter base routes the coolant down into the front of the oil cooler then toward the rear of the engine.
- Once the coolant has passed through the oil cooler it is routed up to the top of the oil cooler then directed towards the front through a port where it is then routed down, out of the cooler, through a port in the block.
Cooling System Flow: EGR Coolers

- Cooled coolant flows out of the supply port of the front cover where it is routed to the horizontal cooler at the left rear side of the engine.
- The coolant then exits the horizontal cooler and is immediately routed into the vertical cooler. The coolant then exits the vertical cooler where it is routed to the return port in the front cover.
- There is a small port at the top of the vertical cooler where coolant is allowed to flow to the EGR valve, cool the valve, then the coolant is routed to the degas bottle. This port is also used as the deaeration port.
- Coolant flows through the EGR coolers and removes heat from the exhaust before the exhaust arrives at the EGR valve.

Coolant Pump & Front Cover

- The coolant pump, (hub and impeller) is mounted into the front cover which is the housing for the water pump.
- The coolant pump impeller pulls coolant from the center of the housing and pushes it outward.
- The coolant pump has a built in reservoir to catch small amounts of coolant that during normal operation of the engine may seep past the seal. This coolant will evaporate over time.

Note: The coolant pump impeller may be damaged if dropped or hit by a hard object.

Injector Sleeve

- The 6.4L Power Stroke uses stainless steel injector sleeves to seal coolant from the injector and to transfer heat from the injector to the coolant.
- The injector sleeve is replaceable.
**Glow Plug Sleeve**

- Glow plug sleeves are used to keep coolant from coming in direct contact with the glow plugs and to seal coolant from the combustion chamber.
- The glow plug sleeve is replaceable. See unique service procedures or the service manual for more details.

**Degas Bottle**

- The degas bottle is located on the left side of the engine compartment and is part of the left side battery tray.
- One of the ports on the bottle is attached to the EGR valve coolant line (which is supplied from the top of the vertical EGR cooler). If this port or hose is blocked, damage could occur to the EGR coolers and/or the EGR valve.
Lubrication System Features

- Integrated Oil Cooler
- No External Oil Passages in Crankcase
- Easy Access Cartridge Style Oil Filter
- External Oil Pressure Regulator

Lubrication System Features

- The 6.4L Power Stroke® Diesel uses an oil cooler that is mounted in the valley of the engine under the oil filter.
- The oil filter is a cartridge style filter mounted on the top of the engine for ease of service. This system also incorporates a valve that drains the oil to the pan when the filter is removed.
- The gerotor oil pump and oil pressure regulator are both located in the front of the engine behind the vibration damper in their own removeable aluminum housing.
Lubrication System Oil Flow

- Oil is drawn from the oil pan through the pick-up tube. The oil is then routed through a passage cast into the upper oil pan before being routed through a passage in the block, a passage in the front cover, and finally to the oil pump inlet.

- The regulator valve utilizes a force, provided via the regulator spring, to apply a pressure equal to 65 psi. Whenever oil pressure exceeds this force, the regulator valve will move downward and allow the excess pressure to bleed off back through a passage that routes the oil back to the inlet side of the pump.

- From the oil pump, oil is directed to the oil cooler and then to the oil filter.

- From the oil filter the oil is supplied to a chamber incorporating five (5) passages. One (1) is to the turbochargers for lubrication. Two (2) are to the EOT and EOP sensors.

- The two (2) other passages are to the tappet oil supply on the right and left banks. The tappet galleries also provide oil to the piston cooling jets.

- Cross drillings off of the right bank tappet gallery supply oil to the main bearings.

- Another cross drilling vertically up from each main bearing supplies oil to the camshaft bearings.

Note: This oil supply routing is different than the 6.0L and uses different bearings which are also placed differently with respect to the oil holes.
LUBRICATION SYSTEM

Pick-up Tube / Oil Aeration
- The pick-up tube supplies oil from the oil pan to the oil pump.
- The pick-up tube is sealed to the upper oil pan utilizing an o-ring. If the o-ring is damaged or missing, it could cause oil aeration.

Oil Pressure Regulator
- The oil pressure regulator is located in the gerotor housing just to the right (when looking at the engine from the front) of the gerotor oil pump.
- The oil pressure regulator is calibrated to open at pressures above 65 psi. It should be closed below that pressure.
- The regulator valve utilizes a force, provided via the regulator spring, to apply a pressure equal to 65 psi. Whenever oil pressure exceeds this force, the regulator valve will move downward and allow the excess pressure to bleed off back through a passage that routes the oil back to the inlet side of the pump.

Gerotor Oil Pump
- The gerotor oil pump is driven off of the flats on the nose of the crankshaft.
- The gerotor oil pump and regulator valve are held in their own removeable housing.
Lube System Flow: Oil Cooler

- Uncooled/Unfiltered oil is directed out of the crankcase at the front left corner of the engine via a drilled passage from the oil pump.

- Uncooled/Unfiltered oil is then directed across the oil cooler cover then down into the oil cooler.

- The oil is then cooled via the oil cooler as it passes through the cooler towards the front of the engine.

- The cooled/unfiltered oil is routed up through the oil cooler cover then through the oil filter base where it enters the oil filter housing (there is a small inlet valve in the oil filter base that the oil must pass through to keep the oil from draining out of the filter housing during non-operation). At this point the oil flows through the filter (from the outside of the filter to the center) where it is cleaned.

Note: There is an oil filter bypass valve located at the top of the oil filter stand pipe (plastic tube the oil filter slides over) which will open and allow unfiltered oil to enter the system whenever a pressure differential of 27 psi is reached.

- After being cleaned via the oil filter, the oil is routed through the oil filter base and into a cavity that has ports to direct the oil to the following areas: left and right oil galleries, turbocharger oil supply, and the EOT & EOP sensors.

Note: There is a drain valve inside the oil filter base which is held closed by the oil filter whenever the oil filter cap is tight. Whenever this cap is loosened, the valve is allowed to open and oil will then escape through this valve, through the oil cooler cover, and then down through a drilled passage in the crankcase to the oil pan.

Note: There is an oil cooler bypass valve inside the oil filter base which will open and let uncooled oil bypass the oil cooler and enter the oil filter housing whenever a pressure differential of 25 psi is reached.
LUBRICATION SYSTEM

Front Cover
- Oil flows from the crankcase to the oil pump via a passage through the upper oil pan, front cover, and oil pump housing.
- When the oil pump is turned by the crankshaft it creates oil flow and pushes oil through two passages. One passage is to the oil cooler and the other is through the oil pressure regulator then to the oil pump inlet (this passage is only used when pressure exceeds 65 psi). When the oil reaches the numerous restrictions throughout the engine, pressure is then created (pressure is the resistance to flow).
- All of the passages from the front cover to the crankcase are sealed with a rubber coated metal, one piece gasket.

Oil Filter Base
- The oil filter base contains the mounting provisions for the oil filter housing and the oil filter stand pipe (which contains the oil filter bypass valve).
- Inside the oil filter housing, there are the following valves: Inlet/Anti drainback valve, oil cooler bypass valve, and the oil filter drain valve.
- The oil filter base also contains the ports for the EOT, EOP, and turbocharger oil supply. These ports are all connected with the cooled/filtered oil passage directly beneath them.

Oil Cooler Cover
- The oil cooler cover has passages in it to direct the flow of coolant and oil.
- Oil is routed from the front of the crankcase to the rear of the housing where it enters the oil cooler. The oil passes from the rear of the oil cooler to the front of the cooler and is cooled in the process. The oil is then sent to the oil filter through the oil filter base. Filtered oil is sent to the oil passages in the crankcase, the turbocharger supply line, and the EOT/EOP sensors.
- The coolant is directed from the front of the crankcase to the front of the oil cooler. It then passes through the oil cooler and cools the oil. As the coolant exits the front of the cooler it is directed down into the coolant stream where it re-enters the crankcase cooling system.

Note: If the oil cooler is damaged it could cause contamination of the lubrication and cooling systems.
**Oil Pump Flow (back side)**

- The oil pump is a gerotor style pump driven off of the flats on the front of the engine’s crankshaft.
- The 6.4L oil pump is held in its own removeable aluminum housing which also contains the regulator valve.
- Oil is drawn into the pump via the combination of atmospheric pressure (applied to the oil in the pan) and the low pressure area that is created between the gerotor gears on the inlet side of the pump whenever the pump is being driven by the crankshaft.
- Once this happens, the oil will flow into the pump and the pump will create a generous amount of oil flow.
- When the oil reaches various restriction throughout the engine, pressure is created.
- Pressure is limited via a pressure regulator valve located inside the pump housing. Whenever a pressure of 65 psi is reached, the regulator valve will open and allow pressurized oil to flow back through a relief passage to the inlet side of the pump, thus regulating system pressure.

**Oil Filter**

- The 6.4L Power Stroke® Diesel uses a cartridge style oil filter, located on the top of the engine.
- When the oil filter is removed, the oil filter housing drain valve is automatically opened to drain most of the oil from the housing.
- The oil filter element snaps into the oil filter lid.

Note: The oil filter lid should be removed before draining the oil from the oil pan so that the oil can drain from the filter housing into the oil pan.

**Turbocharger Oil Supply**

- Oil is supplied to the turbochargers from the oil filter base via a steel oil line, a steel T fitting, and two separate steel lines to each turbo (the high pressure turbocharger oil supply line has a flexible link in it).
- The oil lines are connected to each turbo via banjo fittings and washer gaskets.

Note: The washer gaskets (which are used as a gasket medium) must be replaced each time the banjo fittings are loosened.
**LUBRICATION SYSTEM**

### Turbocharger Oil Drain Tubes

- Oil is supplied to the turbochargers to lubricate and cool the bearings.
- Each turbocharger has its own drain. The high pressure turbocharger uses a removable tube where as the low pressure turbocharger utilizes a small extension tube off of a machined passage in the turbocharger pedestal.
- The high pressure turbocharger drain tube is sealed via two (2) O-rings, one at each end of the tube.
- The low pressure turbocharger drain extension tube is sealed via a rubber coated metal tube.

### Oil Pan / Bed Plate

- The 6.4L Power Stroke® Diesel uses a two piece oil pan. The lower half is wider than the bottom of the engine to increase the oil capacity of the system. Due to this wider oil pan, an upper oil pan is used to adapt the lower pan to the bed plate. The upper pan also acts as an oil baffle.
- The upper pan is bolted to the bed plate. The bed plate replaces the individual main bearing caps, resulting in a more rigid bearing retaining system.
Fuel Supply System Features

• The fuel supply system uses a new Horizontal Fuel Conditioning Module (HFCM). The HFCM filters fuel, separates water, senses water, and recirculates warm fuel through the pump during cool fuel conditions.

• The 6.4L Power Stroke® Diesel also uses 2 fuel filters and a stand alone fuel cooler system.

Fuel Supply System Features

• Horizontal Fuel Conditioning Module (HFCM)
• (1) Chassis Mounted 10 Micron Fuel Filter
• (1) Engine Mounted 4 Micron Fuel Filter
• Water Separator
• Fuel Cooler
Fuel Supply System

Fuel Flow

Engine Fuel Flow

- The fuel pump, located in the Horizontal Fuel Conditioning Module (HFCM), draws fuel from the fuel tank and through a 10 micron fuel filter.

- The HFCM contains the fuel pump, filter, water separator, water in fuel switch, fuel drain, and diesel thermo recirculation valve (DTRM).

- The DTRM controls the flow of fuel returned from the engine mounted filter through the HFCM. If the fuel being drawn from the fuel tank is cooler than a specified temperature then return fuel from the engine is recirculated into the inlet of the pump.

- After the fuel is conditioned by the HFCM, the clean pressurized fuel is sent to the engine mounted fuel filter assembly where particles larger than 4 micron are filtered out of the fuel.

- The engine mounted fuel filter assembly also regulates fuel pressure by releasing excess pressure via a return fuel line back to the HFCM. The engine mounted fuel filter also contains air bleed orifices to remove air and return it to the tank.

- After the fuel is filtered it is routed to the Internal Transfer Pump (ITP).

- The ITP is located inside the high pressure fuel injection pump and is used to increase the fuel pressure supplied to the high pressure fuel injection pump's three (3) internal pistons.

- After the fuel is pressurized it is routed to the high pressure fuel rails and to the fuel injectors via high pressure fuel supply tubes.

- A Pressure Control Valve (PCV) located in the outlet side of the high pressure fuel injection pump controls the fuel pressure by dumping excess fuel into the fuel return line.

- A Fuel Rail Pressure (FRP) sensor located in the right side fuel rail monitors the fuel pressure.

- Return fuel from the injectors is routed through a drilled passage from each cylinder head where it is then united with return fuel from the high pressure fuel injection pump before being sent to the fuel cooler and back to the engine mounted fuel filter.
**HFCM (Horizontal Fuel Conditioning Module)**

- The HFCM is mounted to the frame rail on the drivers side.
- The HFCM is a single module that performs multiple tasks. It separates water from the fuel, senses when water is present in the fuel, filters particulates from the fuel, and creates the fuel flow needed to supply fuel to the engine mounted fuel filter.
- A DTRM (Diesel Thermo Recirculation Module) is also part of the HFCM. It recirculates fuel that returns from the engine mounted fuel filter back into the fuel filter instead of back to the tank.

**HFCM Components**

- The HFCM is composed of six (6) main components:
  - Housing
  - Fuel Filter (10 micron)
  - Fuel Cap
  - Electric Fuel Pump
  - Manifold (contains the fuel inlet check valve)
  - Diesel Thermo Recirculation Module (DTRM) is also part of the HFCM. It recirculates fuel that returns from the engine mounted fuel filter back into the fuel filter instead of back to the tank.

**HFCM Fuel Flow**

- Fuel is drawn into the HFCM from the fuel tank via a supply line.
- Fuel enters the filter housing via a one-way check valve.
- Once in the filter housing, water is separated from the fuel. If large amounts of water are found in the fuel, a sensor in the separator warns the operator of this condition by illuminating a light on the dash.
- Fuel is then drawn through the 10 micron fuel filter and into the fuel pump.
- Conditioned pressurized fuel is then supplied to the engine mounted fuel filter via a fuel supply line. The pump has an internal regulator that limits fuel pressure to 24psi.
- Fuel returning from the pressure regulator on the engine mounted fuel filter comes into the HFCM and a DTRM either allows the fuel to return to the tank or returns it to the unfiltered side of the fuel filter in the HFCM. The DTRM starts to open (recirculating fuel back into the pump) at 80°F (27°C) and is fully open at 50°F (10°C).
**Engine Mounted Fuel Filter**
- An engine mounted fuel filter is mounted to the intake manifold.
- The engine mounted fuel filter is a 4 micron cartridge style filter.
- It also incorporates a fuel pressure regulator (in the standpipe) and an air bleed. Fuel from the regulator is returned to the HFCM.

*NOTE: Please exercise extreme cleanliness when servicing the fuel filter.*

**Fuel Pressure Regulator**
- The fuel pressure regulator is located inside the engine mounted fuel filter housing in the standpipe.
- It regulates fuel pressure by routing unfiltered fuel from the filter housing to the HFCM via a spring loaded poppet style valve.
- The cracking pressure (pressure at which the valve begins to open) of the valve is 2psi +/− 0.5psi. Actual fuel pressure may be above or below this specification.
- The regulated pressure of the valve is 3psi +/− 0.5psi. Actual fuel pressure may be above or below this specification.

*NOTE: The fuel pressure regulator is NOT serviceable separate from the housing! If the regulator needs to be replaced, then the entire housing must be replaced.*

**Fuel Return Banjo Fittings**
- The fuel return lines (located on the front of each cylinder head) utilize a banjo bolt to route the return fuel back to the fuel system.

*NOTE: The 6.0L Power Stroke® Diesel utilized a banjo bolt with a check valve inside. Do not interchange the 6.0L banjo bolt with the 6.4L banjo bolt.*

*NOTE: The 6.4L Power Stroke Diesel uses an open banjo bolt with no check valve. The check valves are no longer needed since the drilled passages in the cylinder heads are now utilized as fuel return passages.*
Air Management System Components

- Series Sequential Turbocharger
- Charge Air Cooler
- Intake Manifold
- Air Filter/Filter Minder
- Exhaust Gas Recirculation (EGR) System

Air Management System Features

- The series sequential turbocharger is a low pressure/high pressure design working in series with a turbocharger actuator on the high pressure turbine controlling the boost pressures.
- The charge air cooler is utilized to reduce the temperature of the pressurized air therefore inducing a cooler/denser air charge into the intake manifold for maximum efficiency.
- An air filter/filter minder combination is utilized to clean the incoming air and provide a means for monitoring the condition of the air filter via the filter minder.
- The EGR system is designed to reduce exhaust emissions.
System Flow

- Air enters the system through the air filter where particles are removed from the air. The air filter has a filter minder on it to warn the operator of a restricted air filter.

- After the air is filtered, the mass of the air and temperature are measured by the mass air flow sensor (MAF) and the intake air temperature sensor #1 (IAT1).

- The filtered air is then directed past the crankcase ventilation system where crankcase vapors and fresh air are mixed.

- After mixing with crankcase vapors the fresh air mixture is drawn into the low pressure turbocharger compressor then the compressed air is sent to the high pressure turbocharger where it is further compressed before being sent to the charge air cooler (CAC).

- The (CAC) cools the compressed air via an air-to-air cooler, then the condensed air passes through the EGR throttle, mixes with cooled EGR gases, then enters the intake manifold.

- The intake manifold directs the cooled air to the intake ports of the cylinder heads.

- The burned air fuel mixture is pushed out of the cylinder into the exhaust manifold which collects the exhaust and routes it to the high pressure turbocharger’s turbine wheel.

- The exhaust up pipe, connected to the passenger side exhaust manifold has a passage that directs exhaust to the exhaust gas recirculation (EGR) coolers and then to the EGR valve.

- The EGR valve controls the flow of exhaust into the intake system where the gases are mixed with intake air to reduce NOx (Oxides of Nitrogen) emissions and noise.

- The hot and expanding exhaust gases that are routed to the series sequential turbocharger turbines, spin the turbine wheels through flow and expansion. The spinning turbine wheels then spin the compressor wheels via common shafts.
Air Filter Housing/ Filter Minder

- The air filter is located on the passenger side of the engine compartment between the battery and the cowl.
- A filter minder, device used to measure filter restriction, is located on the outlet side of the air filter housing just before the MAF sensor.
- Fresh air, from the passenger side fender area, is drawn into the air filter and particulates are removed from the air before going to the engine.

Air Filter Element

- The new air filter element is a replaceable cartridge separate from the housing.
- The air filter is capable of holding 750 grams of particulates before needing replacement.
- The filter element is a honeycomb design.

Charge Air Cooler (CAC)

- The CAC is located in the front of the radiator.
- The CAC is an air to air cooler designed to lower the temperature of the air coming out of the turbocharger outlet before entering the intake manifold.
Series Sequential Turbocharger & Turbocharger Actuator

- The series sequential turbocharger for the 6.4L Power Stroke® Diesel is designed to provide boost control at low and high speeds for improved throttle response.

- The turbocharger actuator is used to control the position of the variable vanes inside the high pressure turbocharger’s turbine housing.

- When the vanes of the turbocharger are closed, the engine will have a higher exhaust back pressure and create more heat which will in turn warm the engine faster in cold ambient conditions.

NOTE: There is an oxidation catalyst in the exhaust pipe for the EGR system that is utilized to crack hydrocarbons before they enter the EGR system.

Turbocharger Actuator

- The variable vanes inside the high pressure turbocharger’s turbine housing are now controlled by the turbocharger actuator.

- The high pressure turbocharger’s turbine housing contains vanes that control the effective size of the housing. These vanes are controlled by the turbocharger actuator by way of a control arm. The control arm connects the actuator to a pivot shaft which connects to the unison ring that moves the vanes.

Turbocharger Actuator Cooler

- The turbocharger actuator is fitted with a cooling plate to reduce the temperature of the electronics inside the actuator housing.

- The actuator cooler uses coolant from the fuel system cooler as the heat exchange medium.
INTAKE AIRFLOW (Blue)
- Air enters the low pressure turbocharger from the air filter.
- The low pressure turbocharger compresses the air and sends the air through the extension tube and the crossover tube prior to entering the high pressure turbocharger.
- The high pressure turbocharger further compresses the air and sends the air to the charge air cooler (CAC) where the air is cooled by an air-to-air cooler prior to entering the intake manifold.

EXHAUST AIRFLOW (Red)
- Exhaust gas enters the high pressure turbocharger turbine housing after being directed through the exhaust up-pipes at the rear of the engine.
- The high pressure turbocharger turbine contains the vanes which are controlled by the turbocharger actuator. These vanes continually change the velocity of the exhaust gas in the high pressure turbocharger turbine.
- After the exhaust gas has passed through the high pressure turbocharger turbine it immediately enters the low pressure turbocharger turbine.
- Once the exhaust gas has powered the low pressure turbocharger turbine the exhaust gas exits through the housing towards the rear of the engine where it is directed to the exhaust aftertreatment system.
Vanes Closed

- During engine operation at low engine speeds and load, little energy is available from the exhaust to generate boost. In order to maximize the use of the energy that is available, the vanes are closed. In doing so, the exhaust gas is accelerated between the vanes and across the turbine wheel. In general, this allows the turbocharger to behave as a small turbocharger, increasing the wheel speed quickly at low speed.

- Closing the vanes also increases the back pressure in the exhaust manifold which is used to drive the exhaust gas through the EGR cooler and valve into the intake manifold.

- The closed vane position is also used for cold ambient warm up.

Vanes Partially Closed

- During engine operation at moderate engine speeds and load, the vanes are commanded partially open.

- The vanes are set to this intermediate position to supply the correct amount of boost to the engine for optimal combustion as well as providing the necessary back pressure to drive EGR.

Note: There is actually an infinite number of vane positions between open and closed. The partially closed picture is for illustration purposes only.

Vanes Open

- During engine operation at high engine speeds and load, there is a great deal of energy available in the exhaust.

- Excessive boost under high speed, high load conditions can negatively affect component durability, therefore the vanes are commanded open preventing turbocharger overspeed.

- Essentially, this allows the turbocharger to act as a large turbocharger with minimal restriction.
EGR Valve
- The ECM controlled EGR (Exhaust Gas Recirculation) valve adds cooled exhaust gases to the intake manifold to reduce NOx emissions.
- The EGR valve is opened during steady state throttle positions when exhaust back pressures are higher than intake manifold pressures (boost).

EGR Flow
- The EGR valve has two valves connected by a common shaft.
- Cooled exhaust gas enters the lower opening of the EGR valve after leaving the vertical EGR cooler.
- When the valve opens it allows the cooled exhaust gas to flow through two passages, one passage is through the upper opening of the EGR valve (upper valve) and the other is through a passage below the EGR valve (lower valve).
- Both passages merge together prior to being mixed with the filtered incoming air before being sent to the intake manifold.

Dual EGR Cooling System
- The EGR cooling system is an air to coolant heat exchanger that is used to cool the exhaust gases before they are sent to the EGR valve.
- The exhaust is routed into the EGR coolers from the exhaust up pipes at the rear of the engine.
- The exhaust is cooled by passing through metal tubes that are surrounded by engine coolant. Depending on conditions, the temperature drop across the coolers could be as much as 850°F.
- The cooled exhaust is then routed to the EGR valve that is mounted to the inlet mixing chamber.
**Throttle Body**
- The throttle body is used to assist with the exhaust aftertreatment system.

**Intake Manifold**
- The intake manifold on the 6.4L Power Stroke® Diesel is made of aluminum and directs the flow of air to the intake ports in the cylinder heads.
- The manifold absolute pressure sensor (MAP) and the intake air temperature 2 sensor (IAT2) are both mounted in the intake manifold.
Fuel Management System Major Components

- Fuel Supply System
- High Pressure Fuel Injection Pump
- High Pressure Fuel Tubes
- Sensors
- Injectors
- Electrical Components
- Actuators

Fuel Management System Features

- Emissions
- Noise
- Rate Control
- Timing Control
- PCV (pressure control valve)
- VCV (volume control valve)

High Pressure Common Rail Fuel System

- The high pressure common rail fuel injection system with piezo electric fuel injectors uses pressurized fuel and electronics to actuate and control fuel injection into the cylinders.

High Pressure Common Rail Direct Injection Fuel System Components

- The fuel management system is comprised of several sub systems.
- Each system works together to deliver excellent power and efficiency while meeting the requirements of emissions regulations.

High Pressure Common Rail Fuel System Advantages

- Emissions and noise have been reduced through improvements in rate, timing control, and multiple injections.
- The high pressure system’s pressure relief function is now controlled by the PCV (Pressure Control Valve), which is mounted to the high pressure fuel injection pump.
- The piezo fuel injectors help reduce noise while delivering optimum performance.
High Pressure Fuel System Flow

- Fuel is supplied to the high pressure fuel injection pump after being filtered by both the HFCM (horizontal fuel conditioning module) and the engine mounted fuel filter.
- The high pressure fuel injection pump is gear driven off of the camshaft gear at the rear of the engine.
- Once the high pressure fuel injection pump pressurizes the fuel it is routed to two (2) high pressure fuel rail supply tubes, one for each bank.
- The high pressure fuel rail supply tubes route the fuel to the high pressure fuel rail located under the valve cover.
- The high pressure fuel rail inlet protrudes through the valve cover spacer at the back of the engine and oil is sealed by a rubber seal.
- The high pressure fuel rail routes fuel to each of the four (4) fuel injectors through four (4) separate fuel injector supply tubes all located under the valve cover.
High Pressure Pump Operation

- After being filtered at the engine mounted fuel filter, fuel is directed to the high pressure fuel injection pump.

- Before fuel enters the Volume Control Valve (VCV) the pressure is stepped up by the Internal Transfer Pump (ITP). The ITP is located inside the high pressure fuel injection pump and is driven by its main shaft.

- The VCV controls how much fuel enters the three (3) main pump pistons.

- A portion of the fuel leaving the ITP is sent to a lubrication valve which allows fuel to lubricate and cool the internal mechanical components of the high pressure fuel injection pump.

- The high pressure fuel injection pump main shaft has an offset journal that actuates each of the three (3) pistons as the shaft rotates.

- The offset journal of the main shaft utilizes a free-spinning hub to make contact with the three (3) pistons.

- The pistons start their compression stroke via the offset journal and are returned to rest via spring pressure.

- The pistons receive fuel from the VCV through a one way check valve. Fuel is drawn into the cylinder while the piston is returning to rest.

- The outlet check valve ball is closed while fuel is being drawn in due to the suction (low pressure area) of the piston returning to rest and the pressure exerted by the other two pistons.

- Once the piston starts its compression stroke, the inlet check valve closes via spring and fuel pressure and the outlet check valve opens due to increasing fuel pressure forcing the check valve ball away from its seat.

- The pressure control valve (PCV) controls the pressure in the system by restricting fuel flow to the return line (pressure is the resistance to flow).
**High Pressure Fuel Injection Pump & Cover**

- The high pressure fuel injection pump is installed in the crankcase.
- The pump is a three (3) piston rotary style pump that is driven by the rear gear train.
- Each bank of cylinders has its own pump outlet and high pressure fuel supply tube.

**PCV (Pressure Control Valve)**

- The PCV and VCV are both installed in the high pressure fuel injection pump.
- The PCV and VCV ARE NOT SERVICEABLE.

**High Pressure Fuel Rail & Fuel Rail Pressure Sensor (FRP)**

- Fuel under extremely high pressures is delivered to the fuel injectors from the fuel rail by way of the fuel injector supply tubes.
- The FRP sensor is located on the engine’s right side high pressure fuel rail.
**Fuel Management System**

**Piezo Electric Fuel Injector**

- Piezo Electrically Actuated
- High Electrical Efficiency
- High Voltage Supply
- Up to 5 Injections Per Combustion Event
- Self extracting hold down clamp

**Fuel Injector Features**

- The injector uses a Piezo Actuator to electrically control the injections with extreme precision.
- The Piezo Actuator is turned on for approximately 0-400 µs (micro second or milliionth of a second) for 2 injections.
- No special tools are needed to remove the injectors from their bore. The injector is slowly removed from its bore by removing the self-extracting hold down clamp bolt.

**Injector & O-ring**

- The injector has one (1) replaceable o-ring on the outside of the body, and one (1) replaceable soft steel combustion gasket on the tip of the injector.
- The injector's piezo actuator has a single two (2) pin connector that is located under the valve cover.
- The fuel charging harness has a single main connection point at the front of the valve cover spacer.

**Piezo Actuator**

- The piezo actuator is an electrically energized device that acts similar to a solenoid but is much more precise.
- A piezo actuator is a composition of piezo discs, that when electrically energized, cause the discs to deform resulting in an expansion. This expansion results in a longitudinal motion thus controlling the injector.
- When energized, the piezo actuator pushes downward against the valve piston. The piezo actuator is returned to its non energized state via the ECM switching the polarity of the electrical feed to the injector.
Valve Piston
- The valve piston is utilized for one main purpose:
  1) It transfers the up and down movement from the Piezo Actuator to the Valve Mushroom.

Valve Mushroom, Return Spring, and Control Piston
- The valve mushroom is a hydraulic check valve that allows high pressure fuel to bleed off into the fuel return passage directly above it whenever the Piezo Actuator is energized.
- The valve mushroom is held in a closed (sealed) position whenever the Piezo Actuator is not energized via high pressure fuel and spring pressure.
- The control piston utilizes its large surface area for a downward force to overcome the pressure exerted by the smaller surface area of the nozzle needle in the high pressure chamber to keep the nozzle needle in a closed position.

Nozzle Needle
- The nozzle needle is an inwardly opening type which lifts off its seat every time the pressure in the high pressure chamber exceeds the pressure in the control piston chamber, i.e. when the piezo is actuated.
- The needle control spring is used to hold the nozzle needle in a closed position.
- Fuel is atomized at high pressure through the nozzle tips six spray holes.
Two Stages of Injection

- Main Injection
- End of Main Injection

Stages of Injection

- The injection cycle has two (2) stages.
- Main injection.
- End of main injection.
- This injection system is capable of performing both steps of the injection cycle up to 5 times per firing cycle.

Pre-Main Injection

- The piezo electric fuel injector is constantly being filled with fuel via the high pressure fuel injection pump.
- High pressure fuel from the high pressure fuel injection pump enters the following areas:
  - control piston chamber (2).
  - spring side of the valve mushroom (4).
  - high pressure chamber (3).
- The needle control spring (9) holds the needle on its seat so that fuel cannot enter the combustion chamber.
- The piezo actuator (1) is in a non-energized state.
Main Injection Step 1

- Fuel under pressure from the rail (7) reaches the control piston chamber (2) and the high pressure chamber (3) of the nozzle needle (5).
- The bore hole to the fuel return line is closed via the valve mushroom (4), which is held closed by a spring and high pressure fuel.
- The surface area of the control piston is much larger than the surface area of the nozzle needle in the high pressure chamber.
- The force (F1) exerted by the control piston due to its larger surface area along with the force of the needle control spring overcomes the force (F2) exerted by the smaller surface area of the nozzle needle in the high pressure chamber which holds the nozzle needle closed.

Main Injection Step 2

- When the piezo actuator (1) is commanded on, the actuator is energized (which causes the piezo discs to deform and create a downward force) and pushes the valve piston (8) downward.
- The downward force of the valve piston pushes the valve mushroom (4) and spring down which opens up a bore hole that connects the high pressure fuel to the fuel return line (6).
- When this happens it allows a small amount of high pressure fuel to enter the fuel return line (6) effectively dropping the pressure in the control piston chamber (2).
- This pressure drop is enough for the force (F2x) on the nozzle needle (5) in the high pressure chamber to overcome the force (F1x) in the control piston chamber (2).
- This allows the nozzle needle (5) to move upward uncovering the six spray holes and allowing high pressure fuel to atomize and enter the combustion chamber.
End of Main Injection Step 1

- The high pressure fuel, that is allowed to escape past the valve mushroom (4) into the fuel return line (6), is routed down a drilled passage to the drain holes in the sides of the injector just below the O-ring seal towards the base of the injector.

- The fuel is then routed through the cylinder head and exits through a banjo fitting on the front side of the cylinder head before being returned to the fuel supply system.

End of Main Injection Step 2

- When the Engine Control Module (ECM) determines that the correct injector on time has been reached, it switches the polarity of the piezo actuator (1) which causes the piezo discs to return to a non-energized state.

- Switching the polarity of the piezo actuator (1) enables the valve mushroom (4) to seat via spring pressure and completely block the bored passage that connects the high pressure fuel to the fuel return line.

- Seating the valve mushroom (4) allows the pressure to build in the control piston chamber (2) and equal that in the high pressure chamber (3).

- Once these two chambers have equalized in pressure the downward force (F1) of the control valve will overcome the upward force (F2) of the nozzle needle due to the larger surface area of the control valve.

- The control valve then moves downward effectively closing the nozzle needle (5), blocking any fuel from entering the combustion chamber.

Electrical Components

- Sensors
- Actuators
- ECM
- Glow Plug System

Components Overview

- The ECM uses information from the sensors to decide which commands to send to the actuators, and the glow plug system.

Sensor Overview

- The ECM sends a reference voltage (Vref) of 5.0 volts (external power) to the pressure sensors and 5.0 volts (internal power) to the temperature sensors, except for CMP and CKP which generate voltage through the collapse of a magnetic field.

- The sensor signals are conditioned by the interface circuits within the ECM. The signals are used as inputs to various control strategies.
AP (Accelerator Pedal Position)

- The AP (Accelerator Pedal) is a three track pedal. The AP incorporates three potentiometers. Throughout the movement of the AP the resistance values of the three potentiometers must agree. During the movement of the AP if any of the three potentiometer readings do not agree, the check engine light will illuminate and the vehicle will continue to perform as normal. If two signals from the AP are lost the ECM will allow the engine to idle only and illuminate the check engine light.

- Having three (3) signals for comparison is an added safety feature.
The ECM supplies a 5 volt reference signal which the Baro sensor uses to produce a linear analog voltage signal that indicates pressure.

The primary function of the Baro sensor is to provide altitude information so that the ECM can adjust timing, fuel quantity, glow plug on time, and turbocharger control.

The Baro sensor is located inside the ECM. If the sensor fails, the ECM must be replaced.
CKP (Crankshaft Position)

- The crankshaft position signal source is a magnetic pickup sensor mounted in the right front side of the engine block.
- The sensor reacts to a trigger wheel positioned on the crankshaft. The trigger wheel is a 60 minus 2 tooth steel disk with 58 evenly spaced teeth and a slot that’s width is equivalent to removing 2 teeth (minus 2 slot) that is the SYNC gap.
- The sensor produces sine waves (converted to square waves via the ECM) for each tooth edge that breaks the magnetic field created by the permanent magnet that is in the end of the sensor.
- Crankshaft speed is derived from the frequency of the CKP sensor signal.
- Crankshaft position can be determined by the synchronization of the CMP peg signal to the CKP minus 2 slot signal.
- Diagnostic information on the CKP input signal is obtained by performing accuracy checks on frequency.
- The ECM needs both the CKP and CMP signal to calculate engine position. The CKP creates a signal that relates to crankshaft speed and position relative to TDC (Top Dead Center). The CMP creates a signal relative to which stroke (compression or exhaust).
The ECM needs both the CKP and CMP signal to calculate engine position. The CMP creates a signal that the ECM uses to indicate a particular bank.

The CMP contains a permanent magnet which creates a magnetic field, when the magnetic field is broken by the peg on the camshaft a signal in the form of a sine wave is created (converted to a square wave by the ECM).

The camshaft position signal source is a magnetic pickup sensor mounted on the left front side of the engine block.

The sensor reacts to a peg, pressed into the camshaft at the front of the engine.

The peg will pass the sensor once per camshaft revolution, the sensor will produce a single pulse correspondingly.

Camshaft speed is derived from the frequency of the CMP sensor signal.

Diagnostic information on the CMP input signal is obtained by performing accuracy checks on signal levels and frequency.
**ECT (Engine Coolant Temperature)**

- The ECT sensor is a two (2) wire thermistor sensor.
- The ECT sensor’s internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The ECT sensor changes resistance when exposed to different temperatures.
- When the temperature of the coolant decreases, the resistance of the thermistor increases and the signal voltage increases.
- When the temperature of the coolant increases, the resistance of the thermistor decreases and the signal voltage decreases.
EGRVP (EGR Valve Position)

- The EGRVP sensor is a three (3) wire potentiometer type sensor.
- The ECM supplies a 5 volt reference voltage that the EGRVP uses to produce a linear analog voltage that indicates the amount of movement of the valve.
- The ECM monitors EGRVP as the engine is operating to modulate the EGR valve.
- This is a closed loop function which means that the ECM continuously monitors the EGRVP to ensure proper valve position.
The EOP (Engine Oil Pressure) is a switch that closes a circuit to ground after engine oil pressure reaches approximately 5-7psi.

This switch controls the oil pressure gauge on the instrument panel. When pressure is above 7psi the gauge will read normal and if the pressure drops below 5 psi the gauge will show 0.

The information from the switch is not sent back to the ECM in any way and is to be used as a reference only.
**EOT (Engine Oil Temperature)**

- The EOT sensor is a two (2) wire thermistor type sensor.
- The EOT sensor's internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The ECM monitors engine oil temperature via the EOT sensor signal to aid in controlling fuel rail pressure (FRP) and fan control.
- The EOT signal allows the ECM to compensate for oil viscosity variations due to temperature changes in the operating environment, ensuring adequate power and torque are available for all operating conditions.
**IAT1 (Intake Air Temperature #1)**

- The Intake Air Temperature1 (IAT1) sensor is a two wire thermistor sensor that is located inside the Mass Air Flow (MAF) sensor.
- The IAT1 sensor's internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The IAT1 sensor's primary function is to measure intake air temperature to aid in controlling EVTG and the glow plug system.
- The MAF/IAT1 sensor is mounted in the intake air piping after the air filter.
**IAT2 (Intake Air Temperature #2)**

- The IAT2 sensor is a two (2) wire thermistor type sensor.
- The IAT2 sensor changes resistance when exposed to different air temperature.
- The primary function of the IAT2 sensor is to provide a feedback signal to the ECM indicating manifold air temperature.
- The IAT2 sensor’s internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The ECM monitors the IAT2 signal to control temperature by adjusting other devices.
**FRP (Fuel Rail Pressure)**

- The FRP sensor is a (3) wire variable capacitance sensor.
- The ECM supplies a 5 volt reference signal (Vref) which the FRP sensor uses to produce a linear analog voltage that indicates pressure.
- The primary function of the FRP sensor is to provide a feedback signal to the ECM indicating the pressure of the fuel in the fuel rail.
- The ECM monitors FRP as the engine is operating to modulate the PCV. This is a closed loop function which means the ECM continuously monitors and adjusts for ideal FRP determined by conditions such as load, speed, and temperature.
- The ECM monitors the FRP signal to determine if the performance of the fuel system is satisfactory.
- During engine operation, if the ECM recognizes that the FRP signal is lower or higher than the value the PCV is trying to achieve the ECM will set a Diagnostic Trouble Code (DTC) and illuminate the amber malfunction indicator lamp on the dash.
- The FRP signal to the ECM is one of the signals used to command the correct injection timing.
- This sensor is replaceable.
MAF (Mass Air Flow)

- The Mass Air Flow (MAF) sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above ambient temperature as measured by a constant cold wire.

- The current required to maintain the temperature of the hot wire is proportional to the mass air flow.

- The MAF sensor then outputs a frequency signal to the ECM proportional to the air mass.
The MAP sensor is a three (3) wire variable capacitance sensor.

The ECM uses the MAP sensor signal to assist in the calculation of EGR duty cycle, Fuel Delivery, and Throttle Body Position.

The ECM measures the MAP signal to determine intake manifold (boost) pressure.

**NOTE:** Washing a hot engine can have negative effects on this sensor!

**NOTE:** The 6.0L engine used a remote mounted MAP sensor.

**NOTE:** Pay special attention to differentiating between the MAP sensor and the EP sensor, do not interchange them!
The EP sensor is a three (3) wire variable capacitance sensor.

The ECM supplies a 5 volt reference signal which the EP sensor uses to produce a linear analog voltage that indicates pressure.

The EP measures exhaust back pressure so that the ECM can control the EGR, and the high pressure turbocharger via the turbocharger actuator.

**NOTE:** Washing a hot engine can have negative effects on this sensor!

**NOTE:** This sensor is gray in color for the 6.4L and black in color for the 6.0L. Some early 6.4L engines may be equipped with black sensors. Do not interchange 6.0L EP sensors with 6.4L EP sensors, these sensors are different.

**NOTE:** Pay special attention to differentiating between the MAP sensor and the EP sensor; do not interchange them!
FTS (Fuel Temperature Sensor)

- The FTS sensor is a two (2) wire thermistor sensor.
- The FTS sensor’s internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The FTS sensor changes resistance when exposed to different temperatures.
- When the temperature of the fuel decreases, the resistance of the thermistor increases and the signal voltage increases.
- When the temperature of the fuel increases, the resistance of the thermistor decreases and the signal voltage decreases.
**EGRT Outlet (EGR Cooler Outlet Temperature)**

- The EGRT Outlet sensor is a two (2) wire thermistor type sensor.
- The EGRT outlet sensor's internal thermistor forms a voltage divider with a pullup resistor inside the ECM.
- The ECM monitors exhaust temperature from the EGRT outlet sensor signal to aid in controlling the EGR valve position and throttle position.
Control Devices
• The 6.4L Power Stroke® Diesel uses eight (8) control devices: Pressure Control Valve, Volume Control Valve, EGR Valve, Turbocharger Actuator, Glow Plug Control Module, Glow Plugs, Fuel Injectors, and the Throttle Body.

Actuators & Control Modules
• Pressure Control Valve (PCV)
• Volume Control Valve (VCV)
• Exhaust Gas Recirculation Valve (EGR)
• Turbocharger Actuator
• Glow Plug Control Module (GPCM)
• Glow Plugs
• Piezo Electric Fuel Injectors
• Throttle Body

PCV (Pressure Control Valve)
• The PCV governs the fuel pressure that is delivered to the fuel injectors via the high pressure fuel rails and fuel supply tubes.
• The PCV also acts as a dampening device for the fluctuations in pressure that occur during fuel delivery through the pump and the injection process.
• The PCV is controlled by the ECM to maintain optimal fuel pressure throughout all engine operating conditions.
• The PCV is permanently mounted to the high pressure pump and is not to be removed. Removal of the PCV will result in replacement of the high pressure fuel injection pump.

NOTE: Fuel caps have been left off for visualization purposes. Always use fuel caps when servicing the high pressure fuel system!

VCV (Volume Control Valve)
• The VCV regulates the delivery of fuel from the internal transfer pump (ITP) to the high pressure pumping elements.
• The VCV adjusts the low pressure side of the system to match the needs of the engine thus increasing efficiency.
• The VCV is permanently mounted to the high pressure pump and is not to be removed. Removal of the VCV will result in replacement of the high pressure fuel injection pump.

NOTE: Fuel caps have been left off for visualization purposes. Always use fuel caps when servicing the high pressure fuel system!
Exhaust Gas Recirculation Valve (EGR Valve)
- The EGR valve is used to mix cooled exhaust gases with intake air to lower emissions and noise.
- The EGR valve is stepper motor controlled
- The valve is powered in both the open and close directions.

Turbocharger Actuator
- The turbocharger actuator is an electronic motor that controls the position of the vanes inside of the high pressure turbocharger’s turbine housing.
- The turbocharger actuator is mounted directly to the high pressure turbo and is connected to the vanes inside the turbine housing by a control arm.

Throttle Body
- The throttle body is operated by a stepper motor controlled by the ECM and assists with the exhaust aftertreatment system.
**ELECTRICAL COMPONENTS**

**ECM (Engine Control Module)**
- The ECM, which is mounted behind the engine on the passenger side cowl, uses sensor inputs to control actuators and send fueling commands to the fuel injectors.
- The ECM controls the fuel and air management system on the 6.4L Power Stroke® Diesel.

**Glow Plug System**
- The glow plug system is used to warm the air in the cylinders to enhance cold weather startability and reduce start up smoke.
- The glow plug system is ECM controlled, and powered by the GPCM.

**Glow Plug Control Module (GPCM) & Glow Plug Harness**
- The GPCM is a unit that controls the glow plugs in order to warm the air in the cylinders.
- The GPCM uses a glow plug enable signal to turn the glow plugs on for a time controlled by the ECM.
- The GPCM is capable of diagnosing a problem with one glow plug and then sending a diagnostic signal to the ECM.
- It also has the ability to turn off one glow plug if a short is detected in that circuit.
- Each bank of glow plugs is connected to the engine wiring harness via a glow plug harness, either left bank or right bank.
- The glow plug harness has four connectors that supply power to the glow plugs and seal oil from escaping through the glow plug access holes.
**Glow Plug**

- The glow plug is used to heat the air in the cylinder.
- The glow plug utilizes a system of sending voltage through a resistance coil to create heat.

**NOTE:** The 6.4L glow plug is very similar to the glow plug used on the 6.0L Power Stroke® Diesel, but they are different. The glow plugs must not be interchanged!

**NOTE:** The 6.4L glow plug uses a green isolator.

---

**Fuel Injector**

- The fuel injector is controlled by an extremely precise piezo electric actuator that can accomplish multiple injections per combustion event.

**NOTE:** Never unplug a fuel injector while the engine is running, serious engine damage could occur!
This page intentionally left blank
Oil Filter: Replacement

- First loosen the oil filter cap which will open the oil filter drain and allow the oil from the filter housing to drain into the crankcase.

- Drain the oil from the oil pan.

- After all of the oil has drained from the oil pan remove the oil filter and discard it in the appropriate location.

- Install the new oil filter element and tighten the oil filter cap to the recommended torque. This will close the oil filter drain.

- Refill crankcase with the correct volume of recommended oil.

Note: The oil filter snaps into the oil filter lid.

Fuel Filter: Replacement

NOTE: Use proper cleanliness practices while servicing the fuel system, do not let any dirt get into the housing!

- Clean all dirt and debris from the engine mounted fuel filter lid thoroughly. Make sure your hands and any tools involved are clean also!

- Remove the fuel filter lid and lift the filter element out of the housing and discard in the appropriate location.

- To avoid fuel spills, use a suction gun or similar device to remove the remaining fuel from the fuel filter housing.

- Install the new filter and tighten the fuel filter lid to the specified torque.

NOTE: Before starting the vehicle, turn the key to the on position for 30 seconds, then key off. Do this 6 times to ensure the fuel filter housing is full of fuel before starting the vehicle.

Fuel System Service Cleanliness: Fuel Injectors, Fuel Rail

NOTE: Use proper cleanliness practices while servicing the fuel system!

- Always use fuel system caps when servicing the fuel injectors or replacing fuel lines.

- Do not have the fuel system open to the elements any longer than is necessary to perform the job at hand.

- Tool # 310-158 (fuel caps)
**Fuel System Service Cleanliness: High Pressure Fuel Injection Pump**

NOTE: Use proper cleanliness practices while servicing the fuel system!

- Always use fuel system caps when servicing the high pressure fuel injection pump.
- Do not have the fuel system open to the elements any longer than is necessary to perform the job at hand.
- Tool # 310-158 (fuel caps)

**Fuel System Service: High Pressure Fuel Tubes**

NOTE: Use proper cleanliness practices while servicing the fuel system!

- High pressure fuel supply tubes must always be replaced once loosened. Never re-use a high pressure tube once it has been loosened under any circumstances!

NOTE: Always use the fuel injector connector disconnect tool (tool # 310-157) whenever disconnecting the fuel injector electrical connector. Failure to use this tool can damage the connector.

**Fuel System Service: High Pressure Fuel Tube Service**

NOTE: Use proper cleanliness practices while servicing the fuel system!

NOTE: Follow the proper service procedures while servicing the fuel system and always use the correct torque!

- Proper torque is crucial with the 6.4L Power Stroke® Diesel’s high pressure fuel system.
- When replacing high pressure fuel tubes, always follow the correct procedure for installation and torque.
Fuel System Service: Fuel Injector Service

NOTE: Use proper cleanliness practices while servicing the fuel system!

NOTE: Follow the proper service procedures while servicing the fuel system and always use the correct torque!

- Proper torque is crucial with the 6.4L Power Stroke® Diesel's high pressure fuel system.
- When replacing fuel injectors, always follow the correct procedure for installation and torque.
- Always use proper protective fuel system caps whenever a tube is removed.
- Avoid cleaning parts near fuel system components.
- Tool # 310-158 (fuel caps)

Fuel System Service: Removing and Installing Injector Gasket

NOTE: Use proper cleanliness practices while servicing the fuel system!

- To remove the gasket, use a razor blade to get between the gasket and injector body, then slowly work the gasket off.
- To install the new gasket, use a 9mm 12 point deep well socket and press the gasket on by hand making sure it is fully seated.
- Make sure the gasket is installed correctly. The raised portion of the gasket should be facing away from the injector body.

Fuel System Service: Fuel Injector Lubrication

NOTE: Use proper cleanliness practices while servicing the fuel system!

- Always replace the O-ring and the steel gasket at the tip of the injector when reinstalling an injector. New injectors come with these items already installed.
- Always lightly lubricate the new O-ring with clean engine oil prior to assembly.
Checking Fuel Pressure

NOTE: Use proper cleanliness practices while servicing the fuel system!

- There is a fuel return pressure test valve (schrader) located on the front of the fuel cooler on the left side of the engine.
- Proper fuel pressure is very important. Too much or too little pressure could be detrimental.
- Follow the proper procedure for checking fuel pressure and make sure the correct specification for supply pressure is achieved.

NOTE: Supply pressure needs to be checked at the horizontal fuel conditioning module (HFCM) outlet.

Turbocharger Lifting Bracket

- Anytime removal or installation of the turbocharger is performed, always use the turbocharger lifting bracket to ensure proper engagement and disengagement of the turbocharger drain tubes.
- The tool is designed to balance the turbochargers and hold the two turbine housings in alignment.
- Tool # 303-1266

Turbocharger Assembly Tool

- The series sequential turbocharger is comprised of two turbochargers, low pressure turbocharger and high pressure turbocharger. When assembling these two turbochargers together, always use the turbocharger assembly tool shown at right.
- Tool # 303-1269
- Follow the proper assembly procedure.
- The turbocharger assembly tool is necessary to ensure that proper alignment/engagement of the two turbochargers is achieved.
**EGR Valve Removal**

- Removing the EGR valve must be performed using the proper EGR valve removal tool.
- This tool is comprised of numerous pieces that must be put together around the EGR valve.
- Once the removal tool is assembled on the valve, the valve can be slowly pulled from its housing.
- Tool # 303-1267

**NOTE:** Pay close attention that the removal tool is installed and used correctly while removing the valve or damage can occur to the EGR valve and/or tool.

**Crossover Tube Seal Removal**

- Crossover tube seal removal requires the use of special service tools; slide hammer, seal removal tools.
- There is a different size removal tool for each opening of the crossover tube.
- Tool # 303-1264

**Crossover Tube Seal Installation**

- When installing new seals into the turbocharger crossover tube, always use the appropriate installation tools.
- The seals for each passage are two (2) different sizes. Make sure you use the correct sized seal installation tool for each sized seal.

**NOTE:** Make sure you have the crossover tube mounted securely to assure proper seal installation.
Cutting T-Joints: Rear Cover

- The T joint is where the bedplate gasket is bonded to the rear cover. This bond must be cut prior to removing the rear cover.
- After you loosen all of the bolts you can slide a cutting tool between the block/bedplate and the rear cover to sever the bonding compound.

NOTE: Failure to cut the T joint will stretch the bedplate gasket and result in an oil leak!

Cutting T-Joints: Front Cover

- The T joint is where the bedplate gasket is bonded to the front cover. This bond must be cut prior to removing the front cover.
- After you loosen all of the bolts you can slide a cutting tool between the block/bedplate and the front cover to sever the bonding compound.

NOTE: Failure to cut the T joint will stretch the bedplate gasket and result in an oil leak!
Checking Oil Pressure

- Remove the engine oil pressure sensor (EOP) from the oil cooler.
- Install an adapter fitting into the port where the EOP was and install an approved oil pressure gauge.
- Follow the proper service procedures for checking oil pressure.
- The thread size for the opening is 7/16 - 20.

Checking Cylinder Head Flatness

- Checking cylinder head flatness for the 6.4L engine is carryover from the late 6.0L procedure.
- Check flatness across the short direction (perpendicular to the longitudinal) of the head.
- Use a straight edge that is calibrated by the manufacturer to be flat within 0.0002 in. per running foot length.
- Set the 0.002” feeler guage on each measurement point (refer to the service procedure graphic in the Ford workshop manual) with the straight edge perpendicular to the longitudinal and not across the area that contains the smaller head bolt holes. Set the straight edge on top of the feeler gauge.
- Use a firm steady force to properly hold the straight edge on top of the feeler gauge. Pull lightly on the feeler guage.
- The head is locally out of flat, and needs replaced if the 0.002” feeler guage is loose and easily slides out from under the straight edge.

Checking Cylinder Head Flatness: Straight Edge Placement

- Never lay the straight edge across the area shaded in red.
- Do not check flatness in the longitudinal direction. Check flatness in the short (perpendicular to longitudinal) direction only.
**EGR Cooler Service**
- Servicing the EGR coolers must be performed in the proper order.
- The coolers must first be installed loosely in the order shown, then torqued in the proper sequence as shown in the Ford workshop manual.
- Proper assembly is crucial due to the extreme temperature changes within the EGR coolers. Temperature changes of 800 deg F are possible.

**Exhaust Up-Pipe Service**
- Assembly of the exhaust up-pipes and EGR cooler supply pipe must be performed in the proper order.
- The pipes must first be installed loosely in the order shown, then torqued in the proper sequence as shown in the Ford workshop manual.

**Intake Manifold And Gaskets**
- When reinstalling the intake manifold, the locating tabs on the intake manifold gasket should face up and toward the center of the engine.

**NOTE:** Failure to follow the assembly steps can result in exhaust leaks.

#### Torque Chart Notes

1. Lightly coat o-ring with clean engine prior to install.
2. Apply threadlock 262 to bolt threads prior to install.
3. Do not reuse. These bolts are one time stretch to yield.
4. Do not reuse exhaust manifold bolts and studbolts.
**FIGURE A: Cylinder Head Bolts**

Step 1: Lightly lubricate M16 head bolt threads and washer faces with clean engine oil prior to assembly.

Step 2: Torque M16 head bolts (labeled 1-10) to 70 lb/ft (95 Nm) in numerical sequence shown.

Step 3: Back out M16 head bolts and retorque to 115 lb/ft (156 Nm) one at a time in numerical sequence shown.

Step 4: Tighten M16 head bolts and additional 90 degrees in numerical sequence shown.

Step 5: Tighten M16 head bolts an additional 90 degrees (2nd time) in numerical sequence shown.

Step 6: Torque M8 head bolts (labeled 11-15) to 18 lb/ft (24 Nm) in numerical sequence shown.

Step 7: Torque M8 head bolts to 23 lb/ft (31 Nm) in numerical sequence shown.

Note: Cylinder head bolts may not be reused once torqued.

Note: If bolt chatter occurs during step 4, repeat step 3 and continue.

**FIGURE B: Flywheel Bolts**

Step 1: Torque the bolts to 44 lbf/in (5 Nm) in the numerical sequence shown.

Step 2: Torque the bolts to 69 lbf/ft (94 Nm) in the numerical sequence shown.

Note: Flywheel bolts may not be reused once torqued.

**FIGURE C: Bedplate Bolts (main bearing bolts)**

Step 1: Torque the bolts to 110 lbf/ft (149 Nm) in the numerical sequence shown.

Step 2: Torque the bolts to 130 lbf/ft (176 Nm) in the numerical sequence shown.

Step 3: Torque the bolts to 170 lbf/ft (231 Nm) in the numerical sequence shown.
FIGURE D: Intake Manifold Bolts
Step 1: Loosely install all bolts in the numerical sequence shown.
Step 2: Torque bolts to 100 lb/in (11Nm) in the numerical sequence shown.
Note: Bolt locations with double circles represent stud bolts.

FIGURE E: Vibration Damper Bolts
Step 1: Torque each bolt to 50 lb/ft (68 Nm) in the numerical sequence shown.
Step 2: Tighten each bolt 90 degrees clockwise in the numerical sequence shown.
Note: Damper bolts may not be reused once torqued.

FIGURE F: Exhaust Manifold Bolts
Step 1: Torque bolts to 18 lb/ft (25Nm) in the numerical sequence shown.
Step 2: Repeat the sequence using the same torque.
Note: Exhaust manifold bolts and studbolts may not be reused once torqued.
FIGURE G: HPCR Fuel Components Assembly Procedure
Hand start and hand snug tube nuts.
Step 1: Install injectors, clamps and bolts and hand start the clamp bolts.
Step 2: Rundown the injector clamp bolts to a torque of 1.5 lb/ft (2 Nm). Injectors will seat while torquing the bolts.
   Note: The injectors must be fully seated and snugged, but moveable for high pressure connector and HP tube alignment.
Step 3: Install the HP rail and hand start two rail mounting bolts.
   Note: Rail must be moveable, but not loose.
Step 4: Remove the four plastic caps from the rail high pressure connectors (HPC’s) and four plastic caps from the injector HPC’s.
Step 5: Obtain four “rail to injector” jumper tubes from the packaging.
Step 6: Position the four (one at a time) between the rail and injectors and fully hand start and seat the tube nuts onto the mating rail and injector HPC’s. Snug the rail and injector tube nuts using the inside-out step sequence (i.e. two inside nuts then two outside nuts) with a tube nut click wrench set to 1.5 lb/ft (2 Nm).
Step 7: Final torque the injector clamp bolts to 28 lb/ft (38 Nm).
Step 8: Final torque the two M8 rail bolts to 23 lb/ft (31 Nm).
Step 9: Torque the rail and injector tube nuts to 106 lb/in (12 Nm +2 / -0).
Step 10: Place a visible mark with a permanent marker on the tube nut and the high pressure fuel rail and fuel injector threaded connection. Turn the tube nuts one flat of the nut which is equal to 60 degrees.

NOTE: Torque the components in the center two cylinders first, then torque the components in the outer two cylinders last.

FIGURE H: High Pressure Pump and Pump-to-Rail HP Tubes Installation Procedure
Step 1: Install and final torque the high pressure fuel injection pump to 45 lb/ft (61 Nm).
Step 2: Install the pump cover gasket and make electrical connections between the pump and gasket. Install the pump cover and fasten the bolts.
Step 3: Remove the four plastic caps from the supply, return, and high pressure rail connectors.
Step 4: Obtain left and right “pump-to-rail” high pressure tubes from the packaging.
Step 5: Position the high pressure tubes between the pump and the rails and fully hand start and seat the tube nuts onto the mating rail and injector HP’s. Snug the rail and injector tube nuts using the inside-out step sequence (i.e. two inside nuts then two outside nuts) with a tube nut click wrench set to 1.5 lb/ft (2 Nm).
Step 7: Final torque the injector clamp bolts to 28 lb/ft (38 Nm).
Step 8: Final torque the two M8 rail bolts to 23 lb/ft (31 Nm).
Step 9: Torque the rail and injector tube nuts to 106 lb/in (12 Nm +2 / -0).
Step 10: Place a visible mark with a permanent marker on the tube nut and the high pressure fuel rail and fuel injector threaded connection. Turn the tube nuts one flat of the nut which is equal to 60 degrees.

FIGURE I: Injector-Pipe-Rail Sub-Assembly Process
Step 1: Place the fuel injectors w/clamps in the head and snug the bolts.
Step 2: Place and snug the fuel rail (leave one thread loose).
Step 3: Place four fuel jumper tubes to injector/fuel rail and start 1-2 threads.
Step 4: Snug injector side tube nuts to 1.5 lb/ft (2 Nm). (Special torque sequence is used, see note below).
Step 5: Snug fuel rail side tube nuts to 1.5 lb/ft (2 Nm). (Special torque sequence is used, see note below).
Step 6: Final torque the fuel rail mounting bolts.
Step 7: Final torque the injector bolts. (Special torque sequence is used, see note below).
Step 8: Final torque the injector side tube nuts to 106 lb/in (12 Nm +2 / -0). (Special torque sequence is used, see note below).
Step 9: Final torque the fuel rail side tube nuts to 106 lb/in (12 Nm +2 / -0). (Special torque sequence is used, see note below).
Step 10: Place a visible mark with a permanent marker on the tube nut and the fuel injector threaded connection. Turn the tube nuts one flat of the nut which is equal to 60 degrees. (Special torque sequence is used, see note below).
Step 11: Place a visible mark with a permanent marker on the tube nut and the high pressure fuel rail threaded connection. Turn the tube nuts one flat of the nut which is equal to 60 degrees. (Special torque sequence is used, see note below).

NOTE: Torque the components in the center two cylinders first, then torque the components in the outer two cylinders last.
FIGURE J: Fulcrum Plate / Rocker Arm Support Assembly

Step 1: Position crankshaft at approximate #1 & #4 cylinder TDC by observing damper dowel pin and clocking it to the 10:30 position (as viewed from the front of the engine).

Step 2: Determine which cylinder is actually in the firing position by installing pushrods, and observing #3 intake and #8 intake.

Step 3: If #3 intake pushrod shows cam lift, this is the #1 firing position. Torque only fulcrum plates #1,2,7,8 per steps 4-6.

If #8 intake pushrod shows cam lift, this is the #4 firing position. Torque only fulcrum plates #3,4,5,6 per steps 4-6.

Step 4: Partially run down both M10 bolts until they just contact the fulcrum plate.

Step 5: Fully run down and torque inboard (upper) bolt to 45 lb/ft (62 Nm).

Step 6: Fully run down and torque outboard (lower) bolt to 45 lb/ft (62 Nm).

Step 7: Rotate crankshaft 360 degrees to position it at the alternate cylinder TDC (dowel pin at 10:30 position).

Step 8: Identify remaining group of fulcrum plates per step 3, and torque per steps 4-6.

FIGURE K: EGR Cooler Mounting Clamps

Horizontal Cooler

Step 1: Pre-torque EGR clamps to 88lb/in (10 Nm).

Step 2: Loosen clamp nuts two full turns.

Step 3: Final torque to 69 lb/in (8 Nm)

Vertical Cooler

Step 1: Pre-torque EGR clamps to 75 lb/in (8.5 Nm).

Step 2: Loosen clamp nuts two full turns.

Step 3: Final torque to 57 lb/in (6.5 Nm).

FIGURE L: Fuel Rail Pressure Sensor (FRP)

Step 1: Snug the sensor hand tight to 1.5 lb/ft (2 Nm)

Step 2: Place a visible mark with a permanent marker on the sensor and the high pressure fuel rail connection. Turn the sensor one flat of the sensor base which is equal to 60 degrees.

<tr>
<td>P2138</td>
<td>Throttle/Pedal Position Sensor/ Switch D / E Voltage Correlation</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>P2199</td>
<td>Intake Air Temperature 1/2 Correlation</td>
<td>This error occurs when the difference between IAT2 and IAT1 is greater than a specified value for a predetermined period of time.</td>
<td>&gt;20 deg C 8 minutes</td>
<td>Wiring, IAT or IAT2 sensor, PCM</td>
</tr>
<tr>
<td>P2228</td>
<td>Barometric Pressure Circuit Low Input</td>
<td>This error occurs when the voltage signal from the barometric pressure circuit falls below a minimum threshold.</td>
<td>Low: &lt; 2.22 V</td>
<td>PCM</td>
</tr>
<tr>
<td>P2229</td>
<td>Barometric Pressure Circuit High Input</td>
<td>This error occurs when the voltage signal from the barometric pressure circuit rises above a maximum threshold.</td>
<td>High: &gt;4.38 V</td>
<td>PCM</td>
</tr>
<tr>
<td>P2230</td>
<td>Barometric Pressure Circuit Intermittent</td>
<td></td>
<td></td>
<td>PCM</td>
</tr>
<tr>
<td>P2262</td>
<td>Turbocharger/Supercharger Boost Pressure Not Detected - Mechanical</td>
<td>This error occurs if the MAP sensor readings are below a calibrated value for a predetermined amount of time.</td>
<td>Engine speed and torque based table &gt;30 sec</td>
<td>System error, CAC hose, MAP sensor plugged,…</td>
</tr>
<tr>
<td>P2263</td>
<td>Turbocharger/Supercharger Boost System Performance</td>
<td>This error occurs when the difference between the gage exhaust pressure and the set point is less than the minimum threshold or greater than the maximum threshold for a predetermined period of time.</td>
<td>Engine speed &gt; 550 rpm Torque set point &gt; 50 N-m, ECT &gt; 81 deg C IAT &gt; -50 deg C No DPF regeneration request EP setpoint is stable Based on a table on N and TQI &gt;5sec</td>
<td>System error</td>
</tr>
<tr>
<td>P2269</td>
<td>Water in Fuel Condition</td>
<td>This error occurs when water is detected in the HFCM.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>P2289</td>
<td>Injector Control Pressure Too High - Engine Off</td>
<td>This error occurs if excessive fuel pressure is present after a predetermined period of time following key off.</td>
<td>0.4 sec after engine switch-off fuel rail pressure (FUP) must be lower than 10MPa.</td>
<td>FUP sensor, wiring to FUP sensor, HP fuel system</td>
</tr>
<tr>
<td>P2291</td>
<td>Injector Control Pressure Too Low - Engine Cranking</td>
<td>This error occurs when enough injection control pressure to start the vehicle cannot be achieved during cranking.</td>
<td></td>
<td>Low pressure fuel system, HP fuel system, FUP sensor and wiring to sensor, battery voltage (crank speed)</td>
</tr>
<tr>
<td>P242A</td>
<td>Exhaust Gas Temperature Sensor Circuit Bank 1 Sensor 3</td>
<td>This error occurs if the EGT3 temperature signal of the exhaust system does not rise sufficiently immediately after a cold-start following an 8-hour soak.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>P242B</td>
<td>Exhaust Gas Temperature Sensor Circuit Range/Performance Bank 1 Sensor 3</td>
<td>This error occurs if the EGT3 temperature sensor signal in the exhaust at key on, following an 8-hour soak, is significantly different than ambient temperature.</td>
<td></td>
<td></td>

</tr>
<tr>
<td>P242F</td>
<td>REGEN</td>
<td>Diesel Particulate Filter Restriction - Ash Accumulation</td>
<td>This error occurs if excessively high exhaust pressures are detected after a regen cycle.</td>
<td></td>
</tr>
<tr>
<td>P244A</td>
<td>REGEN</td>
<td>Diesel Particulate Filter Differential Pressure Too Low</td>
<td>This error occurs if an expected pressure drop through the DPF is lower than the specified value following a regeneration cycle (based on the concept of observed pressure differential).</td>
<td></td>
</tr>
<tr>
<td>P244C</td>
<td>X</td>
<td>Exhaust Temperature too low for Particulate Filter Regeneration</td>
<td>This error occurs if the exhaust temperature is too low to perform a regen cycle of the diesel particulate filter.</td>
<td></td>
</tr>
<tr>
<td>P244D</td>
<td>REGEN</td>
<td>Exhaust Temperature too high for Particulate Filter Regeneration</td>
<td>This error occurs if exhaust temperatures are too high to perform a regen cycle of the diesel particulate filter.</td>
<td></td>
</tr>
<tr>
<td>P2453</td>
<td>X</td>
<td>Diesel Particulate Filter Differential Pressure Sensor Circuit Range/Performance</td>
<td>This error occurs if the differential pressure of the diesel particulate filter reads a constant value while the engine is running.</td>
<td></td>
</tr>
<tr>
<td>P2454</td>
<td>X</td>
<td>Diesel Particulate Filter Differential Pressure Sensor Circuit Low</td>
<td>This error occurs if a short to ground is detected in the diesel particulate filter differential pressure sensor circuit.</td>
<td></td>
</tr>
<tr>
<td>P2455</td>
<td>X</td>
<td>Diesel Particulate Filter Differential Pressure Sensor Circuit High</td>
<td>This error occurs if a short to power occurs in the diesel particulate filter differential pressure sensor circuit.</td>
<td></td>
</tr>
<tr>
<td>P2456</td>
<td>X</td>
<td>Diesel Particulate Filter Differential Pressure Sensor Circuit Intermittent/Erratic</td>
<td>This error occurs if the signal from the diesel particulate filter differential pressure sensor to the PCM is unreadable.</td>
<td></td>
</tr>
